

Sonography

The purpose of the examination requirement is to assess whether individuals have obtained the knowledge and cognitive skills underlying the intelligent performance of the tasks typically required in sonography for practice at entry level. The tasks typically performed were determined by administering a comprehensive practice analysis survey to a nationwide sample of sonographers.¹ The *Task Inventory for Sonography* may be found on ARRT's website (www.arrt.org).

The *Examination Content Specifications for Sonography* and attached content outline identify the knowledge areas underlying performance of the tasks on the *Task Inventory for Sonography*. Every content category can be linked to one or more tasks on the task inventory.

ARRT avoids content when there are multiple resources with conflicting perspectives. Educational programs accredited by a mechanism acceptable to ARRT offer education and experience beyond the minimum requirements specified in the content specifications and clinical competency requirements documents.

This document is not intended to serve as a curriculum guide. Although ARRT programs for certification and registration and educational programs may have related purposes, their functions are clearly different. Educational programs are generally broader in scope and address the subject matter that is included in the content outline, but do not limit themselves to only this content.

The table below presents the major content categories and subcategories covered on the examination. The number of test questions in each category are listed in bold and number of test questions in each subcategory in parentheses. Specific topics within each category are addressed in the content outline, which makes up the remaining pages of this document.
