# FROM THE LEADER IN CABLE AND ANTENNA ANALYSIS ANRITSU INTRODUCES ITS 8<sup>TH</sup> GENERATION SITE MASTER

The wireless communications market continues to evolve at a rapid pace. Operators and service providers have to maintain old networks while upgrading to the new 3G and 4G networks so as to keep up with changing consumer demands. They face the additional challenge of needing to ensure their networks are competitive from a reliability, quality, and cost perspective. As a result of all this, they expect more of the contractors and technicians who maintain their networks. To stay competitive, these contractors and technicians must maintain more base stations than before and complete a wide variety of tasks in the shortest time possible.

Anritsu is pleased to introduce its eighth-generation compact handheld Site Master cable and antenna analyzer series with integrated spectrum analyzer. The new Site Master analyzers offer the same ease of use, ruggedness, and familiar menus as its predecessor S331D and S332D. In addition, Anritsu has enhanced the Site Master to address all the customer requirements and suggestions received over the years.

Indeed, for more than 14 years, Anritsu's Site Master has been the de facto standard for contractors, installers, and wireless service providers who need a portable and rugged cable and antenna analyzer. The Site Master reduces per site maintenance expense, maximizes system up-time, and breaks away from the traditional fix-after-failure maintenance mode by finding small problems before major failures occur. Radio frequency (RF) engineers and field technicians in the U.S. Navy, U.S. Air Force, and other global defense programs responsible for installing and maintaining communication systems use Site Master's frequency domain reflectometry (FDR)-based approach to improve the quality of their communication systems.

Although the new Site Master resides in a modern platform that takes advantage of the latest technologies and is loaded with features that will enhance productivity, it provides more value for better productivity without giving up the familiar look and feel.

## INTEGRATED

The Site Master is a 4 or 6 GHz cable and antenna analyzer that can be configured to include either a 4 or 6 GHz spectrum analyzer, 2-port transmission measurement with built-in 32V bias tee, an interference analyzer with spectrogram displays, a channel scanner, power meter, high accuracy power meter, and GPS receiver for time and location stamping. Because of its multi-functional capabilities, it eliminates the need for you to carry and learn multiple instruments.

## TRUSTED

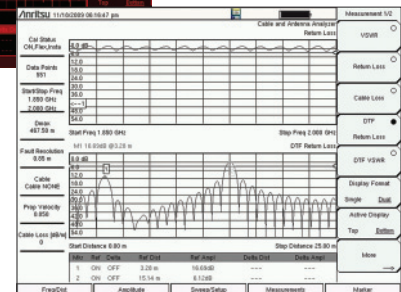

Anritsu builds upon its expertise in portable compact cable and antenna analyzers and spectrum analyzers. The Site Master is approved by all major operators and service providers worldwide.

## DESIGNED FOR FIELD USE

The Site Master was designed specifically for field environments. It weighs less than 6 lbs and its field replaceable Li-Ion battery typically lasts for more than 4 hours. A new bright 8.4-inch color display provides visibility even in broad daylight. With an operating temperature range from -10° to 55 °C, the Site Master will work in the most extreme weather conditions. The analyzer is almost impervious to the bumps and bangs typically encountered by portable field equipment, and its ruggedized case and splash proof design allow you to depend on high performance anywhere, anytime.

# MASTER CABLE & ANTENNA ANALYSIS, ANYWHERE, ANYTIME

The majority of the problems you find at a typical cell site are caused by problematic cables, pinched cables, corroded connectors, antennas, lightning strikes, rain getting into cables, and bullet holes. Degraded cable systems and badly positioned antennas affect overall system coverage and eventually result in dropped calls. Site Master's FDR-based return loss and DTF measurements can pinpoint an antenna problem from ground level in a few seconds, enabling Site Master to identify small problems before they become big problems.

## RETURN LOSS / VSWR

Use the Site Master to make return loss and VSWR and verify that the cable and antenna system conforms to performance specifications.

## CABLE LOSS

Cable Loss metrics measure the level of insertion loss within the cable feedline system. This measurement can be verified prior to deployment, when you have access to both ends. Site Master automatically calculates the average cable loss.

## Return Loss/VSWR

## DISTANCE-TO-FAULT

While the return loss metric is the best measurement to verify the health of a system, distance-to-fault (DTF) is used to troubleshoot systems and locate the problem.

The Site Master's DTF measurement uses the fast Fourier transform to convert frequency data to the time domain and displays signal anomalies with respect to distance. Using the standard trace math feature, you can monitor small relative changes over time.

## Distance-to-Fault

## 2-PORT TRANSMISSION MEASUREMENTS (OPTION 21)

Cellular/PCS and 3G base stations today use diplexers, duplexers, and tower-mounted amplifiers to extend the coverage area. Site Master's 2-port transmission measurement enables you to make gain, isolation, and insertion loss measurements as well as verify sector-to-sector isolation.

## BIAS TEE (OPTION 10)

The built-in bias tee can be turned on as needed to place +12 to +32V on the center conductor of the RF in port, eliminating the need for you to carry external supplies in the field.

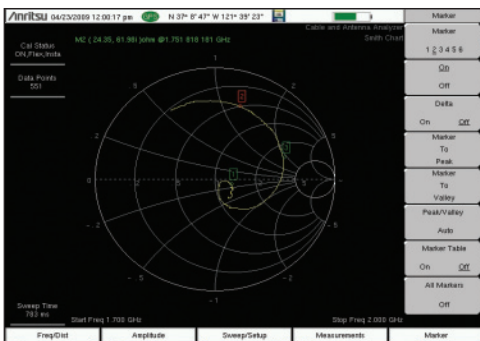

## 2-Port Transmission Measurements

# ENHANCE PRODUCTIVITY WITH DUAL DISPLAYS AND INSTANT CALIBRATION

Dual Display

Smith Chart

InstaCal

## DUAL DISPLAY

The dual display enables users to view two cable and antenna measurements on the same display. Because you can control the top and bottom displays independently, you can set markers and limit lines on each display. This results in significant time savings as there's no need to make two measurements.

## SMITH CHART AND 1-PORT PHASE DISPLAY

The cable and antenna analyzer also includes Smith chart and 1-port phase measurement displays for when you need to tune antennas and phase match cables.

## INSTACAL™ CALIBRATION

Although you need to get the job done as quickly as possible, you still need to make reliable and accurate measurements. Anritsu's InstaCal module enables you to make accurate calibrations at the end of the phase stable cable without connecting a short/open/load. You only need to connect the InstaCal module once and everything is done automatically. This calibration method can cut the calibration time by as much as 50 percent and still deliver accurate calibrations. Directivity specification for the InstaCal module is 38 dB for the entire frequency range, allowing you to make fast and accurate measurements in no time—and with no in-between connections.

## STANDARD OSL CALIBRATION

Open-Short-Load (OSL) calibration comes standard with the Site Master. All errors from source match, directivity, and frequency response are mathematically removed, allowing you to make accurate vector-corrected measurements. Directivity is usually the main contributor to measurement uncertainty, and corrected directivity of 42 dB or better is common using Anritsu's precision components.

## FLEXCAL™

The Site Master's FlexCal™ broadband calibration feature is an OSL-based calibration method that allows you to perform a broadband calibration and change the frequency range after calibration without having to recalibrate the instrument.

## RF IMMUNITY

Site Master's special dithering RF immunity solution enables you to make accurate cable and antenna measurements even in the presence of strong RF activity from co-located cell sites.

# HIGH PERFORMANCE, COMPACT SPECTRUM ANALYSIS

Site Master S332E and the S362E Site Master with integrated spectrum analysis capability provide users with a high-performance, easy-to-use, feature-rich spectrum analyzer for field environments and applications requiring mobility.

Site Master's integrated high performance spectrum analyzer makes it ideal for a broad range of activities, including spectrum monitoring, AM/FM broadcast proofing, interference analysis, field strength measurements, transmitter spectrum analysis, electro magnetic field strength, signal strength mapping, and overall field analysis of cellular 2G/3G/4G, land mobile radio, Wi-Fi, and broadcast signals.

Dynamic Range Performance

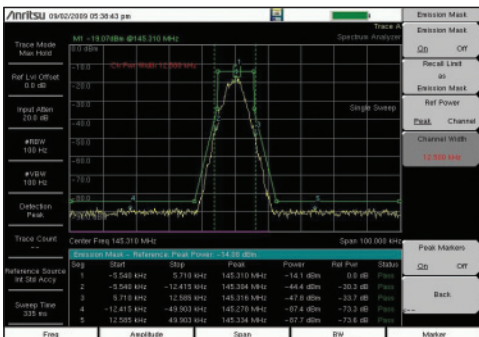

## HIGH PERFORMANCE

Site Master's dynamic range is better than 95 dB in 10 Hz RBW, allowing you to measure very small signals in the presence of much larger signals. The picture to the left demonstrates the dynamic range in Site Master.

Additionally, Site Master's phase noise is better than -100 dBc/Hz at 10 kHz offset. The integrated 4 or 6 GHz spectrum analyzer delivers -152 dBm DANL in 10 Hz RBW.

## FAST SWEEP SPEED

It automatically sets the fastest sweep possible and still delivers accurate measurements. This allows you to rely on Site Master to optimize accuracy and consistency.

Emission Mask Measurements

## SMART MEASUREMENTS

Site Master comes with commonly needed and easily accessed measurements built in. These include field strength, occupied bandwidth, channel power, adjacent channel power ratio (ACPR), AM/FM/SSB demodulation, emission mask, and carrier-to-interference (C/I) ratio measurements.

## OCCUPIED BANDWIDTH

Determine the amount of spectrum used by a modulated signal. You can choose between two different methods of determining bandwidth: the percent-of-power method or the "x" dB down method.

## ADJACENT CHANNEL POWER RATIO

Adjacent Channel Power Ratio is a common transmitter measurement. This is the ratio of the amount of leakage power in the adjacent channel to the total transmitted power in the main channel. This measurement can be used to replace the traditional two-tone intermodulation distortion (IMD) test for system non-linear behavior. The Site Master allows you to perform this measurement quickly and accurately.

## FIELD STRENGTH MEASUREMENTS

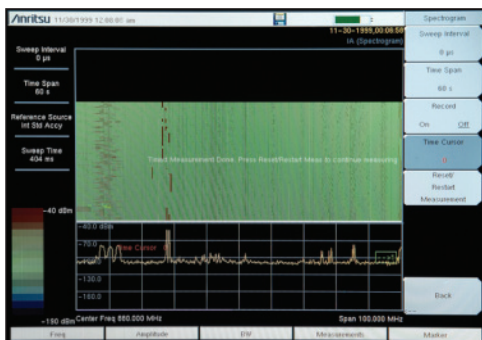

The Site Master can determine the effects of electromagnetic fields caused by transmitter systems, and automatically take specific antenna factors of the connected antenna into account.

# MASTER THE LOCATION OF INTERFERENCE

As the wireless industry continues to expand, more diverse uses for the radio spectrum emerge and the number of signals that may potentially cause interference is constantly increasing.

Compounding the problem are the many sources that can generate interference including intentional radiators, un-intentional radiators, and self interference. Interference causes Carrier-to-Interference degradation robbing the network of capacity. The goal of these measurements is to resolve interference issues as quickly as possible.

**Spectrogram Display**

## INTERFERENCE ANALYSIS (OPTION 25)

The interference analyzer option provides you with a spectrogram display, RSSI, signal strength meter, and signal ID. Site Master's integrated spectrum analyzer can detect signals as low as -152 dBm.

## SPECTROGRAM DISPLAY

This option provides you with a three-dimensional display of frequency, power, and time of the spectrum activity to identify intermittent interference and track signal levels over time. The Site Master allows you to save a history up to one week.

**Signal Strength Meter**

## RECEIVED SINGLE STRENGTH INDICATOR (RSSI)

You can use the Site Master's RSSI measurement to observe the signal strength of a single frequency over time, and collect data for up to one week.

## SIGNAL STRENGTH METER

The Site Master's signal strength meter can locate an interfering signal by using a directional antenna and measuring the signal strength. It displays power in Watts, dBm, in the graphical analog meter display, and by an audible beep proportional to its strength.

**Signal ID**

## SIGNAL ID

Site Master's signal ID feature in the interference analyzer can help you quickly identify the type of the interfering signal. You can configure this measurement to identify all signals in the selected band or to simply monitor one single interfering frequency. The Site Master then displays results that include center frequency, signal bandwidth, and signal type (FM, GSM/GPRS/EDGE, W-CDMA/HSDPA, CDMA/EV-DO, WLAN).

## AM/FM/SSB DEMODULATION

A built-in demodulator for AM, narrowband FM, wideband FM and single sideband allows you to easily identify the interfering signal.

## SPECTRUM ANALYZER HIGHLIGHTS

# POWER MEASUREMENTS FOR A WIDE RANGE OF APPLICATIONS

The Anritsu Site Master provides many different power measurements to support a wide range of applications. The high-accuracy broadband sensor family provides the best accuracy ( $\pm 0.16$  dB) over a wide frequency range. The power meter is ideal for users looking to making channelized measurements in a few keystrokes with minimal training. Site Master's channel power measurement also makes channelized measurements but requires more knowledge and is recommended for more advanced users. And when you are measuring multiple channels, the channel scanner is your perfect choice.
