PXIe-5645 Specifications

Definitions

Warranted specifications describe the performance of a model under stated operating conditions and are covered by the model warranty.

Characteristics describe values that are relevant to the use of the model under stated operating conditions but are not covered by the model warranty.

- **Typical** specifications describe the performance met by a majority of models.
- **Typical-95** specifications describe the performance met by 95% ($\approx 2\sigma$) of models with a 95% confidence.
- **Nominal** specifications describe an attribute that is based on design, conformance testing, or supplemental testing.

Specifications are **Warranted** unless otherwise noted.

Conditions

Specifications are valid under the following conditions unless otherwise noted.

- 30 minutes warm-up time.
- Calibration cycle maintained.
- Chassis fan speed is set to High. In addition, NI recommends using slot blockers and EMC filler panels in empty module slots to minimize temperature drift.
- Calibration IP is used properly during the creation of custom FPGA bitfiles.
- Calibration Interconnect cable remains connected between CAL IN and CAL OUT front panel connectors.
- The cable connecting CAL IN to CAL OUT has not been removed or tampered with.

- Reference Clock source: Internal
- RF IN reference level: 0 dBm
- RF OUT power level: 0 dBm
- LO tuning mode: Fractional
- LO PLL loop bandwidth: Medium
- LO step size: 200 kHz
- LO frequency: 2.4 GHz
- LO source: Internal
- I/Q IN voltage range: 0.5 V_{pk-pk} differential
- I/Q IN common-mode voltage: 0 V
- I/Q OUT voltage range: 0.5 V_{pk-pk} differential
- I/Q OUT common-mode voltage: 0 V
- I/Q OUT load impedance: 50 Ω
- Digital equalization enabled for both RF and I/Q channels

Frequency

The following characteristics are common to both RF IN and RF OUT ports.

Frequency range	65 MHz to 6 GHz
Bandwidth ^[1]	80 MHz
Tuning resolution ^[2]	<1 Hz
LO step size	
Fractional mode	Programmable step size, 200 kHz default
Integer mode	4 MHz, 5 MHz, 6 MHz, 12 MHz, 24 MHz

Frequency Settling Time

Table 1. Maximum Frequency Settling Time

Settling Time	Maximum Time (ms)		
	Low Loop Bandwidth	Medium Loop Bandwidth ^[3] (default)	High Loop Bandwidth
$\leq 1 \times 10^{-6}$ of final frequency	1.1	0.95	0.38
$\leq 0.1 \times 10^{-6}$ of final frequency	1.2	1.05	0.4

The default medium loop bandwidth refers to a setting that adjusts PLL to balance tuning speed and phase noise, and it does not necessarily result in loop bandwidth between low and high.

This specification includes only frequency settling and excludes any residual amplitude settling.

Internal Frequency Reference

Initial adjustment accuracy	$\pm 200 \times 10^{-9}$
Temperature stability	$\pm 1 \times 10^{-6}$, maximum
Aging	$\pm 1 \times 10^{-6}$ per year, maximum
Accuracy	Initial adjustment accuracy \pm Aging \pm Temperature stability

Frequency Reference Input (REF IN)

	±0.30, typical	±0.55, typical	±0.33, typical	±0.55, typical

Conditions: Reference level -30 dBm to +30 dBm; measured at 3.75 MHz offset from the configured center frequency; measurement performed after the PXIe-5645 has settled.

For reference levels <-30 dBm, absolute amplitude gain accuracy is ±0.6 dB, typical for frequencies ≤ 4 GHz, and ±0.8 dB, typical for frequencies > 4 GHz. Performance depends on signal-to-noise ratio.

This specification is valid only when the module is operating within the specified ambient temperature range and within the specified range from the last self-calibration temperature, as measured with the onboard temperature sensors.

Frequency Response

Conditions: Reference levels -30 dBm to +30 dBm; Measured at ADC.

Center Frequency	Self-Calibration °C ± 1 °C	Self-Calibration °C ± 5 °C
This specification is valid only when the module is operating within the specified ambient temperature range and within the specified range from the last self-calibration temperature, as measured with the onboard temperature sensors.		
For optimal performance, NI recommends running self-calibration when the PXIe-5645 temperature drifts ± 5 °C from the temperature at the last self-calibration. For temperature changes >±5 °C from self-calibration, LO residual power is -35 dB.

Conditions: Reference levels -30 dBm to +30 dBm.

This specification describes the maximum residual sideband image within an 80 MHz bandwidth at a given RF center frequency. Bandwidth is restricted to 20 MHz for LO frequencies ≤ 109 MHz.

This specification is valid only when the module is operating within the specified ambient temperature range and within the specified range from the last self-calibration temperature, as measured with the onboard temperature sensors.

For optimal performance, NI recommends running self-calibration when the PXIe-5645 temperature drifts ± 5 °C from the temperature at the last self-calibration. For temperature changes $>\pm 5$ °C from self-calibration, residual image suppression is -40 dBc.

Conditions: CW average power -70 dBm to +10 dBm.

For power <-70 dBm, highly accurate generation can be achieved using digital attenuation, which relies on DAC linearity.

The absolute amplitude accuracy is measured at 3.75 MHz offset from the configured center frequency. The absolute amplitude accuracy measurements are made after the PXIe-5645 has settled.

This specification is valid only when the module is operating within the specified ambient temperature range and within the specified range from the last self-calibration temperature, as measured with the onboard temperature sensors.

I/Q Interface

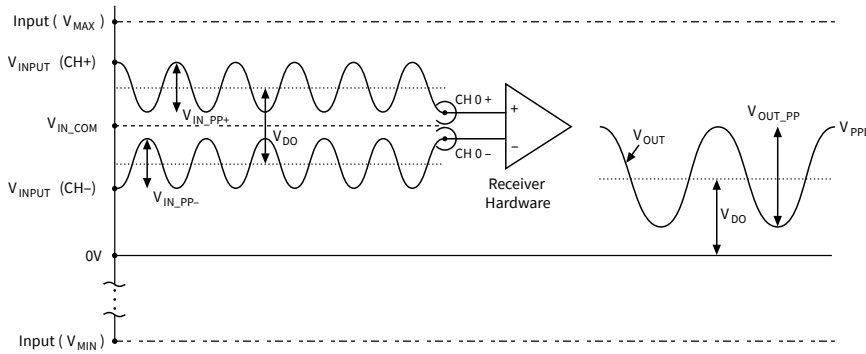

Differential and Single-Ended Operation

The I/Q inputs and outputs of the PXIe-5645 support both single-ended and differential operation. This section explains some of the fundamental analog signal processing that occurs in the first stages of the I/Q receiver.

A differential signal system has a positive component ($V_{\text{INPUT}}(\text{CH}+)$) and a negative component ($V_{\text{INPUT}}(\text{CH}-)$). The differential signal can have a common-mode offset ($V_{\text{IN_COM}}$) shared by both $V_{\text{INPUT}}(\text{CH}+)$ and $V_{\text{INPUT}}(\text{CH}-)$. The differential input signal is superimposed on the common-mode offset. The input circuitry rejects the input common-mode offset signal.

In a differential system, any noise present on both $V_{\text{INPUT}}(\text{CH}+)$ and $V_{\text{INPUT}}(\text{CH}-)$ gets rejected. Differential systems also double the dynamic range compared to a single-ended system with the same voltage swing. The following figure illustrates the key concepts of differential offset and common-mode offset associated with a differential system.

Figure 16. Definition of Common-Mode Offset and Differential Offset

where

- V_{IN_PP+} represents the peak-to-peak amplitude of the positive AC input signal
- V_{IN_PP-} represents the peak-to-peak amplitude of the negative AC input signal
- V_{DO} represents the differential offset voltage
- V_{IN_COM} represents the common-mode offset voltage
- V_{OUT_PP} represents the peak-to-peak amplitude of the output signal

In the previous figure, the input common-mode voltage is not present after the first stage of the receiver system. The signal remaining at the output of the receiver circuitry is the signal of interest.

Note The differential signal can have an offset between $V_{INPUT}(CH+)$ and $V_{INPUT}(CH-)$. This is known as the **differential offset** and is retained by the receiver circuitry.

In an I/Q analyzer, a differential offset can occur because of LO leakage or harmonics. In the case of I/Q generation, a differential offset can cause spurs and magnitude error.

In a phase-balanced differential system, the peak-to-peak amplitude of the positive AC input signal (V_{IN_PP+}) is equal to the peak-to-peak amplitude of the negative AC input signal (V_{IN_PP-}). The AC peak-to-peak amplitude of the output signal is the sum

of V_{IN_PP+} and V_{IN_PP-} . A more general definition for the output voltage regardless of phase is the difference between V_{IN_PP+} and V_{IN_PP-} described by the following equation:

$$V_{OUT} = (V_{INPUT(CH+)}) - (V_{INPUT(CH-)})$$

The common-mode offset, which represents the rejected component common to both signals, is described by the following equation:

$$V_{IN_COM} = [(V_{INPUT(CH+)}) + (V_{INPUT(CH-)})]/2$$

Compliance and Certifications

Safety Compliance Standards

This product is designed to meet the requirements of the following electrical equipment safety standards for measurement, control, and laboratory use:

- IEC 61010-1, EN 61010-1
- UL 61010-1, CSA C22.2 No. 61010-1

Note For safety certifications, refer to the product label or the [Product Certifications and Declarations](#) section.

Electromagnetic Compatibility

This product meets the requirements of the following EMC standards for electrical equipment for measurement, control, and laboratory use:

- EN 61326-1 (IEC 61326-1): Class A emissions; Basic immunity
- EN 55011 (CISPR 11): Group 1, Class A emissions
- EN 55022 (CISPR 22): Class A emissions
- EN 55024 (CISPR 24): Immunity
- AS/NZS CISPR 11: Group 1, Class A emissions
- AS/NZS CISPR 22: Class A emissions
- FCC 47 CFR Part 15B: Class A emissions
- ICES-001: Class A emissions

Note In the United States (per FCC 47 CFR), Class A equipment is intended for use in commercial, light-industrial, and heavy-industrial locations. In Europe, Canada, Australia, and New Zealand (per CISPR 11), Class A equipment is intended for use only in heavy-industrial locations.

Note Group 1 equipment (per CISPR 11) is any industrial, scientific, or medical equipment that does not intentionally generate radio frequency energy for the treatment of material or inspection/analysis purposes.

Note For EMC declarations, certifications, and additional information, refer to the [Product Certifications and Declarations](#) section.

Product Certifications and Declarations

Environmental Management

NI is committed to designing and manufacturing products in an environmentally responsible manner. NI recognizes that eliminating certain hazardous substances from our products is beneficial to the environment and to NI customers.

For additional environmental information, refer to the **Engineering a Healthy Planet** web page at ni.com/environment. This page contains the environmental regulations and directives with which NI complies, as well as other environmental information not included in this document.

EU and UK Customers

-  **Waste Electrical and Electronic Equipment (WEEE)**—At the end of the product life cycle, all NI products must be disposed of according to local laws and regulations. For more information about how to recycle NI products in your region, visit ni.com/environment/weee.

¹ Digitally equalized RF input and RF output bandwidth. Bandwidth is restricted to 20 MHz for LO frequencies ≤ 109 MHz and restricted to 40 MHz for LO frequencies between 109 MHz and 375 MHz.

² Tuning resolution combines LO step size capability and frequency shift DSP implemented on the FPGA.

³ Medium loop bandwidth is available only in fractional mode.

4 Conditions: Measured port: LO Out; Reference Clock: internal; medium loop bandwidth.

5 Conditions: Measured port: LO Out; Reference Clock: internal.

6 Constant LO frequency, constant RF input signal, varying input reference level.

7 LO tuning across harmonic filter bands, constant RF input signal, varying input reference level.

8 Measurement performed after self-calibration.

9 dBr is relative to the full scale of the configured RF reference level.

10 Conditions: VSA frequency range 109 MHz to 6 GHz. Measurement performed after self-calibration.

11 Measurement performed after self-calibration.

12

Conditions: Two -10 dBm tones, 700 kHz apart at RF IN; reference level: -2 dBm; nominal noise floor: -145 dBm/Hz.

13 Higher output is uncalibrated and may be compressed.

14 Up to 12 dB crest factor, based on 3GPP LTE uplink requirements.

15 Average output power \geq -100 dBm.

16 Constant LO frequency, varying RF output power range. Power levels \leq 0 dBm. 175 μ s for power levels $>$ 0 dBm.

17 LO tuning across harmonic filter bands.

18 Harmonic suppression is reduced in this frequency range. As a result, offset errors may occur depending on whether you are using a true RMS device, such as a power meter.

19 Conditions: Output -10 dBm CW tone. Measurement performed after self-calibration.

20 Measured using 1 MHz baseband signal -1 dBFS; fundamental signal measured at +6 dBm CW.

21 Measurement performed after self-calibration.

22 Measurement performed after self-calibration.

23 Conditions: EVM signal: 20 MHz bandwidth; 64 QAM signal. Pulse-shape filtering: root-raised-cosine, alpha=0.25; PXIe-5645 reference level: -10 dBm; Reference Clock source: internal; record length: 300 μ s. Generator: PXIe-5673; power (average): -14 dBm; Reference Clock source: internal.

24 Conditions: 20 MHz bandwidth, 64 QAM; centered at LO frequency or offset digitally as listed.

25 Conditions: EVM signal: 20 MHz bandwidth; 64 QAM signal. Pulse-shape filtering: root-raised cosine, alpha=0.25; PXIe-5645 peak output power: -10 dBm; Reference Clock source: internal. Measurement instrument: PXIe-5665; reference level: -10 dBm; Reference Clock source: internal; record length: 300 μ s.

26 Conditions: 20 MHz bandwidth, 64 QAM; centered at LO frequency or offset digitally as listed.

27 Common-mode voltage plus peak AC voltage cannot exceed the maximum input voltage of 2.5 V.

28 Common-mode voltage plus peak AC voltage cannot exceed the maximum input voltage of 2.5 V. Valid for all differential levels.

- 29 To use the I or Q channel in single-ended terminal configuration, connect the positive (+) terminal to the active signal and terminate the negative (-) terminal with a 50 Ω termination.
- 30 Configured for 0 V common-mode, differential. Measured CW at 500 kHz.
- 31 Complex equalized bandwidth is the combined bandwidth of I and Q channels. Valid only when using identical gain and termination settings for each I/Q channel.
- 32 Referenced to 500 kHz. Digital equalization enabled. Valid only when using identical gain and termination settings for each I/Q channel.
- 33 Digital equalization enabled. Valid only when using identical gain and termination settings for each I/Q channel.
- 34 Digital equalization enabled. Valid only when using identical gain and termination settings for each I/Q channel.
- 35 Digital equalization enabled. Valid only when using identical gain and termination settings for each I/Q channel.
- 36 Measured at 23 °C. Valid only when using identical gain and termination settings for each I/Q channel.
- 37 Measured with a -1 dBFS tone at 9.9 MHz.
- 38 Measured with a fixed -1 dBFS input signal at 9.9 MHz. Specification is valid within 20 MHz of bandwidth for I or Q.
- 39 Measured with a -1 dBFS input signal at 9.9 MHz. Specification is valid within 20 MHz of bandwidth for I or Q.
- 40 Measured in the presence of a -40 dBFS signal.
- 41 Measured with a -1 dBFS input signal at 9.9 MHz.
- 42 Measured with 10 MHz bandpass filter to remove stimulus-related noise and distortion.

43 Measured with two-tone stimulus; each tone is -7 dBFS with a 200 kHz spacing; 9.9 MHz and 10.1 MHz tone frequencies.

44 Measured with two-tone stimulus; each tone is -7 dBFS with a 200 kHz spacing; 9.9 MHz and 10.1 MHz tone frequencies.

45 High-impedance load.

46 Valid for all differential levels.

47 To use the I or Q channel in single-ended terminal configuration, connect the positive (+) terminal to the active signal and terminate the negative (-) terminal with a 50 Ω termination.

48 Measured with a DMM. Measured with both output terminals terminated to ground through a high impedance.

49 High-impedance load.

50 Configured for 0 V common-mode, differential. Measured CW at 500 kHz.

51 Complex equalized bandwidth is the combined bandwidth of I and Q channels. Valid only when using identical gain and termination settings for each I/Q channel.

52 Referenced to 500 kHz. Valid only when using identical gain and termination settings for each I/Q channel.

53 Valid only when using identical gain and termination settings for each I/Q channel.

54 Valid only when using identical gain and termination settings for each I/Q channel.

55 Digital equalization enabled. Valid only when using identical gain and termination settings for each I/Q channel.

56 Generated -1 dBFS CW at 9.9 MHz. Includes harmonic and nonharmonic content. Short pattern waveforms may degrade the distortion performance by 3 dB.

57 Generated -1 dBFS CW at 9.9 MHz.

58 Terminated into 50 Ω .

59 Generated -1 dBFS CW at 9.9 MHz.

60 Generating -7 dBFS CW tones at 9.9 MHz and 10.1 MHz.

61 Generating -1 dBFS CW tones at 9.9 MHz and 10.1 MHz.

62 Conditions: RF OUT loopback to RF IN; 5,800 MHz; 80 MHz bandwidth; average power: -30 dBm to -5 dBm; 20 packets; 16 OFDM data symbols; MCS=9; 256 QAM.

63 Conditions: RF OUT loopback to RF IN; 2,412 MHz; 20 MHz bandwidth; average power -10 dBm; reference level: auto-leveled based on real-time average power measurement; averages: 10; pulse-shaping filter: Gaussian reference; CCK 11 Mbps.

64 Single channel uplink only.

65 Conditions: DL Test Model 1 (64DPCH); RF output level: -10 dBm average; RF OUT loopback to RF IN; measured results better than -66 dB.

66 Conditions: I/Q OUT loopback to I/Q IN; 0.5 V_{pk-pk} range, differential; 80 MHz bandwidth; 20 packets; 16 OFDM data symbols; MCS=9; 256 QAM.

67 Conditions: I/Q OUT loopback to I/Q IN; 0.5 V_{pk-pk} range, differential; 20 MHz, 40 MHz bandwidth; 20 packets; 3/4 coding rate; 64 QAM.

68 Conditions: I/Q OUT loopback to I/Q IN; 0.5 V_{pk-pk} range, differential; 20 MHz bandwidth; 20 packets; 3/4 coding rate; 64 QAM.

69 Conditions: I/Q OUT loopback to I/Q IN; 0.5 V_{pk-pk} range, differential; 20 MHz bandwidth; 20 packets; 3/4 coding rate; 64 QAM.

70 Conditions: I/Q OUT loopback to I/Q IN; 0.5 V_{pk-pk} range, differential; 20 MHz bandwidth; Averages: 10; Pulse shaping filter: Gaussian; CCK: 11 Mbps.

71 Conditions: I/Q OUT loopback to I/Q IN; $0.5 V_{pk-pk}$ range, differential; 5 MHz, 10 MHz, 20 MHz bandwidth; single channel uplink only; 64 QAM PUSCH modulation.

72 ADCs are dual-channel components with each channel assigned to I and Q, respectively.

73 I/Q data rates lower than 120 MS/s are achieved using fractional decimation.

74 DACs are dual-channel components with each channel assigned to I and Q, respectively. DAC sample rate is internally interpolated to 960 MS/s, automatically configured.

75 I/Q data rates lower than 120 MS/s are achieved using fractional interpolation.

76 For modulated signals, peak instantaneous power not to exceed +36 dBm.

77 For modulated signals, peak instantaneous power not to exceed corresponding peak power of specified CW.

78 When tuning to 65 MHz to 375 MHz using the RF IN channel, the exported LO is twice the RF frequency requested.

79 When tuning to 65 MHz to 375 MHz using the RF IN channel, the exported LO is twice the RF frequency requested.

80 Negative terminal must be externally terminated in single-ended mode.

81 Negative terminal must be externally terminated in single-ended mode.

82 **Frequency Accuracy = Tolerance × Reference Frequency**

83 $1 V_{rms}$ to $3.5 V_{rms}$, typical. Jitter performance improves with increased slew rate of input signal.

84 Refer to the [Internal Frequency Reference](#) for accuracy.

85 Voltage levels are guaranteed by design through the digital buffer specifications.
