

# Amplifier CMA 156

## CMA 156 - 6 Phase Current Amplifier (6 x 25 A)

VEHV1010

Recommended for tests requiring

- higher currents/power in the current path.
- more than 3/6 current channels (e.g. for testing 3-winding transformer differential protection).

The CMA 156 contains 6 independent current channels, arranged in two isolated groups (A, B). By connecting all six current phases in parallel, for example, a power of up to 420 VA and current up to 150 A can be delivered, which allows testing a wide range of electromechanical relays.
