

IMPROVING THE VISIBILITY OF T&M ASSETS

Get the Most from Your Valuable Assets

From semiconductor and telecommunications to aerospace and defense, many companies today suffer from ineffective management of their test and measurement equipment. Delays in product development and testing and increasing costs are not uncommon. Global enterprises and field-service organizations rely on Electro Rent to increase the efficiency and productivity of their testing operations and assets.

With all asset data in a single location, better decision-making and deeper insights become possible. Customizable dashboards provide near-real-time information on asset location, status and availability, which leads to more sharing, higher utilization and accelerated timelines. Engineers and lab managers can find what they need when they need it, review repair history, check calibration certificates and sign up for a variety of notifications.

With increased visibility, management can monitor key metrics as they improve over time, improving throughput, lowering costs and increasing return on invested capital. The system enables more informed decision-making on asset acquisition, renting vs. buying and “right-sizing” the portfolio, including disposal of underutilized assets and reduction of unnecessary purchasing.

Customizable dashboards provide near-real-time information on asset location, status and availability. Engineers and lab managers can find what they need when they need it, review repair history, check calibration certificates and sign up for a variety of automated notifications.

HOW DO I GET STARTED?

Once all your assets are loaded into a database, we conduct an audit. Typically, such audits reveal which assets can be disposed of (due to low utilization or technical obsolescence), and which additional assets may be needed to support increased productivity. The audit team then conducts training to familiarize new users with the system.

A variety of asset optimization solutions are available, some of which include real-time Bluetooth® for automated asset tracking. All solutions include management dashboards, project management, calibration and repair tracking, and phone and e-mail customer support.

The system enables more informed decision-making on asset acquisition, renting vs. buying and “right-sizing” the portfolio, including disposal of underutilized assets and reduction of unnecessary purchasing.

Our Portfolio of Solutions

MyER Portal: this complimentary customer portal provides basic functionality to improve the efficiency and productivity of test and measurement operations.

Assist for Field Organizations: An app-based platform, assist helps testing organizations manage test equipment, including bar coding, tracking and scheduling owned or rented test assets.

Enterprise Solutions: a complete global software and database system that includes an audit, inventory assessment, and professional advice and recommendations regarding the equipment portfolio.

Enterprise Solution with Real-Time Equipment Tracking: Similar to our Enterprise Solution, this system adds real-time Bluetooth® tracking for field-service organizations.
