This is a subset of technical specifications for the N5230A Options 140, 145, 146, 240, 245, and 246 network analyzers.

- **Option 140**, 300 kHz to 13.5 GHz, 4-port with standard test set and standard power range
- **Option 145**, 300 kHz to 13.5 GHz, 4-port with configurable test set and extended power range
- **Option 146**, 300 kHz to 13.5 GHz, 4-port with configurable test set and extended power range with internal second source
- **Option 240**, 300 kHz to 20 GHz, 4-port with standard test set and standard power range
- **Option 245**, 300 kHz to 20 GHz, 4-port with configurable test set and extended power range
- **Option 246**, 300 kHz to 20 GHz, 4-port with configurable test set and extended power range with internal second source

This N5230A document provides technical specifications for the following calibration kit and ECal module only: 85052B and N4433A. Please download our free Uncertainty Calculator from www.agilent.com/find/na_calculator to generate the curves for your calibration kit and PNA setup.

Definitions

All specifications and characteristics apply over a 25 °C ±5 °C range (unless otherwise stated) and 90 minutes after the instrument has been turned on.

Specification (spec.): Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

Characteristic (char.): A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

Typical (typ.): Expected performance of an average unit which does not include guardbands. It is not covered by the product warranty.

Nominal (nom.): A general, descriptive term that does not imply a level of performance. It is not covered by the product warranty.

Calibration: The process of measuring known standards to characterize a network analyzer's systematic (repeatable) errors.

Corrected (residual): Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.

Uncorrected (raw): Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

Standard: When referring to the analyzer, this includes no options unless noted otherwise.

Corrected System Performance

The specifications in this section apply for measurements made with the N5230A Options 140, 145, 146, 240, 245, and 246 analyzers with the following conditions:

- 10 Hz IF bandwidth
- No averaging applied to data
- Isolation calibration with an averaging factor of 8

Table 1. System dynamic range at test port¹

Standard configuration and standard power range (Options 140, 240)

Description	Specification (dB) at test port	Typical (dB) at test port
300 kHz to 10 MHz ²		111
10 MHz to 4 GHz ²	120	128
4 to 6 GHz	118	129
6 to 10.5 GHz	115	127
10.5 to 13.5 GHz	107	119
13.5 to 15 GHz	107	119
15 to 20 GHz	103	116

Configurable test set and extended power range (Options 145, 245)

Configurable test set, extended power range, and internal second source (Options 146, 246)

Description	Specification (dB) at test port	Typical (dB) at test port
300 kHz to 10 MHz ²		111
10 MHz to 4 GHz ²	120	128
4 to 6 GHz	118	128
6 to 10.5 GHz	113	125
10.5 to 13.5 GHz	105	117
13.5 to 15 GHz	105	117
15 to 20 GHz	98	115

1. The system dynamic range is calculated as the difference between the noise floor and the specified source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account.
2. May be degraded by 10 dB at particular frequencies (multiples of 5 MHz) below 500 MHz due to spurious receiver residuals. Methods are available to regain the full dynamic range.

Table 2. Extended dynamic range¹

**Configurable test set and extended power range (Options 145, 245)
Configurable test set, extended power range, and internal second source
(Options 146, 246)**

Description	Specification (dB) at direct receiver access input	Typical (dB) at direct receiver access input
300 kHz to 10 MHz ²		124
10 MHz to 4 GHz ²	136	
4 to 6 GHz	134	
6 to 10.5 GHz	129	
10.5 to 13.5 GHz	121	
13.5 to 15 GHz	121	
15 to 20 GHz	114	

1. The direct receiver access input extended dynamic range is calculated as the difference between the direct receiver access input noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account. This setup should only be used when the receiver input will never exceed its compression or damage level. When the analyzer is in segment sweep mode, it can have predefined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when receiver compression or damage may occur (i.e. devices with low insertion loss). The extended range is only available in one-path transmission measurements.
2. May be degraded by 10 dB at particular frequencies (multiples of 5 MHz) below 500 MHz due to spurious receiver residuals. Methods are available to regain the full dynamic range.

N5230A Option 140/145/146/240/245/246

Corrected system performance with 3.5 mm connectors¹

Note: For any S_{ij} reflection measurement:

$$S_{ji} = 0$$

For any S_{ij} transmission measurement:

$$S_{ji} = S_{ij} \text{ when } S_{ij} \leq 1$$

$$S_{ji} = 1/S_{ij} \text{ when } S_{ij} \geq 1$$

$$S_{kk} = 0 \text{ for all } k$$

Table 8. Dynamic Accuracy (specification)

Accuracy of the test port input power reading relative to the reference input power level. Dynamic accuracy is verified with the following measurements:

- Compression over frequency
- IF linearity at a single frequency of 1.195 GHz using a reference level of -20 dBm for an input power range of 0 to -110 dBm

Table 9. Test port input (group delay)

Description	Specification	Supplemental information (typ.)
Aperture (selectable)		(frequency span)/(number of points -1)
Maximum aperture		20% of frequency span
Range		0.5 x (1/minimum aperture)
Maximum delay		Limited to measuring no more than 180° of phase change within the minimum aperture
Accuracy		See graph below. Char.

The following graph shows characteristic group delay accuracy with full 2-port calibration and a 10 Hz IF bandwidth. Insertion loss is assumed to be < 2 dB and electrical length to be ten meters.

For any S_{ij} group delay measurement, $S_{ii} = 0$, $S_{ij} = 0$, $S_{kl} = 0$ for all $kl \neq ij$

Group delay (typical)

In general, the following formula can be used to determine the accuracy, in seconds, of specific group delay measurement:

$$\pm \text{Phase Accuracy (deg)} / [360^\circ \text{ Aperture (Hz)}]$$

Depending on the aperture and device length, the phase accuracy used is either incremental phase accuracy or worst case phase accuracy.

Remove all doubt

Our repair and calibration services will get your equipment back to you, performing like new, when promised. You will get full value out of your Agilent equipment throughout its lifetime. Your equipment will be serviced by Agilent-trained technicians using the latest factory calibration procedures, automated repair diagnostics and genuine parts. You will always have the utmost confidence in your measurements.

Agilent offers a wide range of additional expert test and measurement services for your equipment, including initial start-up assistance onsite education and training, as well as design, system integration, and project management.
