

## AP SERIES

### Autoranging power supplies for bench or systems use

The AP series power supplies utilise an autoranging concept and can provide a wide and adjustable range of voltage and current combinations within their constant power envelope. This is ideal for bench or systems use because a single unit will often meet future as well as present needs.

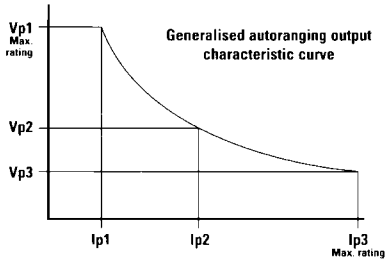

#### FEATURES

- 500W, 1kW and 3kW models available
- Manual or IEEE 488.2 bus (GPIB)
- High resolution programming and readback with interface options
- Constant voltage or constant current operation
- Operating modes:  
local or bus control, remote sensing,  
remote programming, auto parallel,  
auto series, auto tracking
- Master/slave operation for more  
power or higher voltages
- Digital LED panel meters and  
annunciators
- Easily rack mountable, ideal for  
systems use
- Active power factor correction on  
3kW models

## AUTORANGING - the single unit solution to a variety of power needs

The AP series power supplies utilise an autoranging concept and can provide a wide and adjustable range of voltage and current combinations within their constant power envelope. This is ideal for bench or systems use because a single unit will often meet your future as well as present needs.

### Compact and efficient

Because they utilise an efficient switchmode topology AP Series units are compact and relatively lightweight for their considerable power outputs. They are suitable for stand-alone bench use or for integrating into systems.

### Powerful outputs

The voltage and current capability of the units is shown graphically in the SPECIFICATION section and can be determined when in use from two front panel bar graphs which show volts with available current, and current with available volts.

Output can be constant voltage or constant current and the mode in use is shown by LED status indicators (flags) on the front panel. Twin digital LED panel meters are provided to monitor both voltage and current. Output is adjustable from near zero to maximum volts and from near zero to maximum current by 10-turn front panel controls. Alternatively, the output can be controlled from the rear panel using a variable voltage or resistance, or can be remotely programmed by a computer on the GPIB if option /H is fitted.

An OUTPUT ENABLE button is provided on the front panel. When not pressed in, the panel meters and bargraphs display the prospective output settings. This is done without having to open circuit the load to set the voltage, or short circuit the output to set the current. When the OUTPUT ENABLE

button is pressed in, the meters and bargraphs display the actual voltage and current being delivered to the load.

### Protected

CV/CI power supplies are inherently safe as both output voltage and current will be automatically limited to the preset values. However, to enable the user to protect the load from inadvertent application of an excessive voltage, the units incorporate an overvoltage limit (OVL) which causes the supply to down program when the preset level is exceeded. It can be adjusted by rotating the 'adjust OVL' control through the front panel. The OVL level can be monitored on the voltmeter by depressing the 'display OVL' button. When the OUTPUT ENABLE button is not pressed in, the trip level can be accurately set without activating shutdown or disconnecting the load. A tripped OVL can be reset manually or via a GPIB shutdown/enable command. When used with option /H the OVL may be set remotely overriding the local setting. If the power supply overheats, due to restricted airflow for example, the output shuts down automatically and the overtemperature flag POT' in the status window lights up. When the unit has cooled sufficiently, the output returns and the flag turns off. Both 'OVL' and 'OT' conditions can be reset using the OUTPUT ENABLE switch.

Protection is also provided against severe reductions in AC power line input (brownout) which could cause overheating or unreliable operation. The output will shut down until the AC power line returns within operating tolerances. An undervoltage condition can be recognised by 'UNREG' and 'ENABLED' lamps being illuminated, together with near zero readings on the panel meters.

Should the terminal cover be removed whilst the unit is operating a

microswitch inhibits the output circuitry and the panel meters indicate zero.

### Remote sensing

When supplying a load which is some distance from the output, the remote sensing terminals should be used to maintain regulation at the load rather than at the unit's output terminals. Up to 0.5 volts drop per load lead can be allowed for without degrading the specified CV performance.

### Multiple unit operation

Up to four units can be connected for auto-parallel (master/slave) operation to increase total output current. Control can be maintained from one master unit whether the units are used under local or GPIB control (option /H needed for GPIB). Several units can be connected for auto-series (master/slave) operation, the floating voltage limitation being 120V DC maximum between output and ground. Positive or negative tracking outputs can be achieved by grounding the centre of the series combination, or at any unit in the chain if an unbalanced positive and negative supply is required. Neither rail should exceed 120V DC with respect to ground.

### Current monitoring

An amplified current monitor output signal of 0 to 5 volts for zero to full current is provided. This is useful for the remote display of output current. It also provides the capability for auto parallelling power supplies should this be a requirement.

### GPIB interfacing

A GPIB interface card is available as a factory fitted option (/H). When fitted this allows high resolution (up to 1:4000) control and readback of output. The option also activates LEDs which indicate if the power supply is 'talking' or 'listening' or whether a 'service request' signal has been sent.

## FEATURES

- Compact, efficient switch-mode power supplies
- For bench or systems use
- 500W, 1kW and 3kW models available
- Autoranging, continuously variable stabilised DC output in a wide variety of voltage/current combinations
- Operating modes:
  - constant voltage or constant current
  - auto-parallel
  - auto-series
  - auto-tracking
  - remote sensing
  - remote programming (by resistance or voltage)
  - via GPIB (option /H must be fitted to chosen AP unit)
- Ten-turn voltage and current controls for precise settings
- Twin digital LED display panels. Display voltage and current simultaneously. Display overvoltage setting. Bar graph indication of voltage/current capacity. Status indicators and warning flags for CV/CI mode, OVL, OT and UNREG conditions
- Front panel adjustable overvoltage limit (remotely programmable if /H fitted)
- Front panel output ENABLE switch
- Current monitoring output
- Simple rack mounting system (optional)
- Option /H will allow an AP unit to be controlled by a computer on the GPIB

Programmable functions (listen) with resolution up to 1:4000:

- Set voltage
- Set current
- Set OVL (overrides manual setting)
- Enable/shut down
- Inhibit manual OVL
- Control SRQ
- Changing mode (bus/local) Readback functions (talk) with resolution up to 1:4000:
  - Actual voltage at load
  - Actual current at load
  - Present status (CV or DI, OVL, OT, UNREG, SRQ)

## Common Specification

See following pages for performance parameters of 500W, 1kW and 3kW units.

### OUTPUT CONTROL

1. Front panel 10-turn potentiometers
2. Remote programming by resistance
3. Remote programming by voltage
4. GPIB control (option /H fitted in chosen AP unit)

### RESOLUTION OF FRONT PANEL CONTROLS

0.07% of maximum output voltage, typical

0.07% of maximum output current, typical

### STABILITY

Typical drift in output over 8 hours assuming constant line, load and ambient temperature after 30 minutes warm up:  
 $\pm 0.03\%$  of output  $\pm 5\text{mV}$  (CV)  
 $\pm 0.03\%$  of output  $\pm 5\text{mA}$  (CI)

### OVERVOLTAGE LIMIT (OVL)

Multiturn potentiometer adjustable through front panel. Trip level adjustable from approximately 2 volts to 2 volts above rated output voltage. Accuracy of trip setting  $\pm(1\%+1.5\text{V})$

### CURRENT MONITOR

OV to 5V amplified current monitor output for zero to full output current. Accuracy  $1\% + 10\text{mV}$ . Output impedance  $5\text{k}\Omega$  nominal

### REMOTE PROGRAMMING

Referenced to negative sense by voltage: 0 to 5V provides zero to full output voltage or current. Accuracy 0.1% output  $+0.1\%$  f.s. (CV) 1% output  $+1\%$  f.s. (CI)  
By resistance: 0 to  $4\text{k}7\Omega$  provides zero to full output voltage or current Accuracy 0.2% output  $+0.1\%$  f.s. (CV) 1.1% output  $+0.1\%$  f.s. (CI)

### REMOTE INHIBIT

Inhibit signal of +4V to +60V to rear panel terminals shuts down output

### REMOTE SENSING

Maintains nominal voltage at load by correcting for up to 0.5V in each output lead

### EMC

Complies with EN50081-1 and EN50082-1

### SAFETY STANDARDS

Design to comply with EN61 01 0-1

### METERING AND STATUS INDICATORS

Twin 3 digit panel meters with red, high efficiency LEDs of 12.5mm character height. Used to display voltage and current simultaneously. The overvoltage limit setting can also be displayed. For meter accuracy see following pages. Twin bar graphs of 20 segments each give approximate indications of voltage and current availability and provide trend indications. Status flags within the panel meters give LED indication of CV and CI operating modes. A central status window (see illustration) annunciates unregulated condition (UNREG), over temperature (OT), and over voltage (OVL). In addition, if option /H is fitted, BUS indicates when the unit is under GPIB control, LSN indicates receiving data from bus, TLK indicates transmitting data on bus, and SRQ indicates that a 'service request' has been initiated

### ENVIRONMENTAL

Operating temperature range 0 to 40°C

Storage temperature range -20 to +60°C

Cooling by fan. Draws front exhausts rear.

Over temperature trip protection featured.

### RACK MOUNTING

Any AP unit can easily be fitted into a standard 19" rack using the optional mounting kit (see illustration). The rear of the unit must be supported.

These compact autoranging bench or systems power supplies use a switch-mode topology to provide a wide range of adjustable voltage and current combinations within a 500 watt power envelope.

Output may be controlled manually or via the GPIB (with option /H). Constant voltage or constant current is available and operating modes are local or bus, remote sensing, simple remote programming by voltage or resistance, auto parallel, auto series and auto tracking Master/slave connections are provided for systems requiring more power or higher voltages AP units are simple to rack mount.

The AP range is now produced by Advance Hivolt, the world's leading manufacturer of high voltage power supplies.

This consolidation of low voltage and high voltage power supplies is aimed at providing our customers with a greater range of power solutions from a single source.

Advance Hivolt design and manufacture high voltage power supplies for such applications as Ion Implantation, Lasers, Photomultipliers and X-ray systems.

Please contact Advance Hivolt sales for further details.
