MP1900A

Signal Quality Analyzer-R

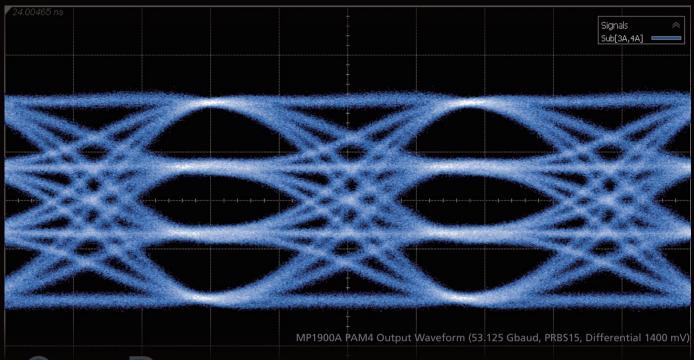

Data center and network traffic volumes are increasing exponentially as mobile networks start upgrading to 5G and 'Big Data' applications become popular. As a consequence, physical-layer devices are required to support faster transmission speeds, larger data capacities, and assured signal quality, in turn making signal integrity analysis ever more important. To meet these needs, Anritsu has implemented more accurate signal integrity tests, such as bit error rate (BER) measurements, crosstalk tests, Jitter Tolerance tests, etc., in its MP1900A test solution for 64 Gbaud NRZ/PAM4.

The Signal Quality Analyzer-R MP1900A series is a modular 8-slot high-performance BERT. Installing multiple modules in the slots not only supports today's 400 GbE analysis requirements, but also provides futureproof support for next-generation 800G measurements.

# High-Quality Data Output with High-Speed Tr/Tf and Low Intrinsic Jitter

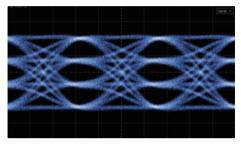

The PAM4 PPG MU196020A supports high-quality data output with low noise and low distortion over high analog band with Tr/Tf of 8.5 ms and Intrinsic Jitter of 170 fs rms. High-reproducibility measurement supported by PAM4 signals with open 3-Eye waveform. Additionally, Emphasis and Linearity control functions optimize PAM4 data output to DUT.

# 4Tap Emphasis Output at 20 dB max.

The 4Tap Emphasis function (MU196020A-011) can generate the Pre-Emphasis and De-Emphasis signals required by each standard for maximum rates of 64.2G. Since each tap can be changed independently up to 20 dB, corrected waveforms for various transmission paths can be output with good reproducibility.

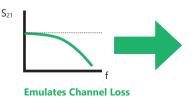

Pre-Emphasis/De-Emphasis Optimization Effects

In addition, using the Channel Emulator and ISI functions\* makes it easy to output waveforms with simulated channel loss for high-speed devices, as well as waveforms corrected for loss. As a result, not only is testing of multiple channel boards unnecessary, but also high-reproducibility channel-loss-dependent tests of high-speed device performance are easy, helping shorten development times.

# Freely Control PAM4 Output Linearity

The PAM4 PPG can freely control the PAM4 output linearity to change the output level for each Eye independently.

As well as correcting the output waveform of non-linear devices, a PAM4 waveform with variable RLM (Ratio of Level Mismatch) can be output with good reproducibility.

## **PAM4 Pattern Editor**

PAM4 evaluation test patterns (SSPRQ, PRBS13Q, PRBS31Q, etc.) are built-in as standard. Versatile pattern output settings, such as MSB/LSB bit inversion, Gray Coder ON/OFF, Precoder ON/OFF, and a Bit Shift function (changes MSB bit phase by  $\pm 256$  bits) support combined use of various DUT internal error counters and analysis of error occurrence locations.

# **FEC Pattern Generation**

The option can be used to generate FEC patterns and add FEC errors (MU196020A-042).

Supported FEC patterns are 400/200/100/25 GbE, and both NRZ and PAM4 FEC patterns can be generated at each lane. Additionally, the FEC error addition function can be used for evaluating the DUT FEC.

# 116-Gbit/s PAM4 Signal Error-Free BER Measurement using High Input Sensitivity Function

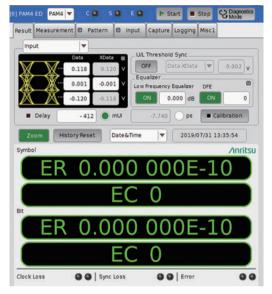

Combining the PAM4 ED MU196040B with the PAM4 PPG supports BER measurements of 116-Gbit/s (58 Gbaud) PAM4 signals. Error-free BER measurement is achieved by the industry-best high sensitivity performance of 23 mV @26 Gbaud and 36 mV @53 Gbaud. The resulting high-accuracy BER measurements make it easy to troubleshoot previously difficult-to-analyze PAM4 devices. In addition, true DUT performance can be verified because even CEI-112G-VSR-defined worst-case stressed signals can be received at low-error rates (<E-8), exceeding the specifications.

Moreover, even the BER of Eye waveforms closed by ISI can be measured using the built-in Equalizer function.

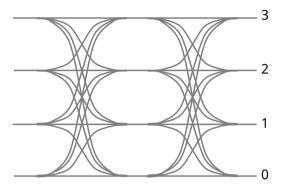

Built-in Equalizer Configuration

# **Built-in Clock Recovery**

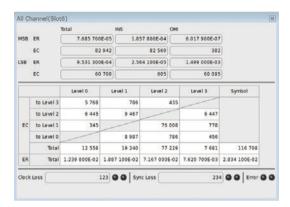

An optional Clock Recovery function (MU196040B-021, 022, 023) can be installed in the PAM4 ED, eliminating both the need for an external clock recovery unit, and phase adjustment of the ED Data/Clock. Jitter Tolerance tests of PHY devices, such as QSFP-DD and SERDES with different Tx and Rx signal clocks, as well as BER measurements of AOC device are supported for the ideal, high cost-performance test solution.

# Symbol Error Rate (SER) Evaluation

Since the error rate at each symbol (0 to 3) of the PAM4 signal can be confirmed, error occurrence locations can be analyzed in more detail (MU196040B-041).

PAM4 Symbol Image

Error Rate Measurement Screen per Symbol Error Level

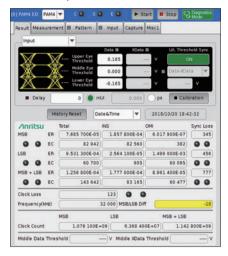

# **Auto-Search Function**

In addition to the Upper, Middle, and Lower Eye measurement points (voltage threshold value and phase), automatic detection of the optimum Equalizer setting automatically detects the conditions required for the best BER results. Moreover, automatic detection of the PAM4 Symbol Logic and Gray Coding conditions supports automatic evaluation of pattern conditions for the input PAM4 Symbol coding, providing a more efficient measurement environment.

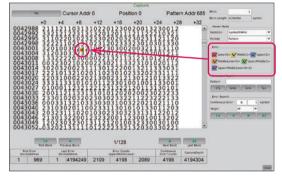

# **Diagnostics Mode Function**

This function is for troubleshooting logic errors, such as inverted logic, and bit skew between the MSB and LSB. When these types of logic errors prevent synchronization, the cause can be specified from the MSB and LSB error results, and from the bit skew detection result.

# **Capture Function**

Input test-pattern data can be captured in blocks of up to 8 Mbits (4 million symbols) for input and analysis of results. The captured test pattern is displayed as lines of symbol patterns with color-coded errors for easy analysis.

Color-Coded Error Capture Screen

# **Logging Function**

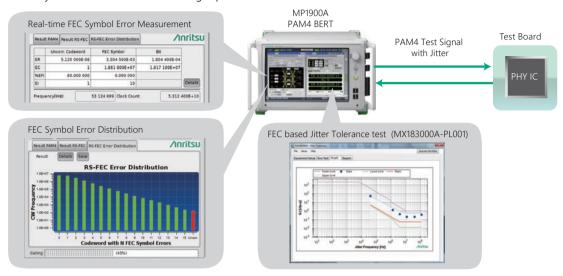

Changes in DUT performance and stability over time can be evaluated by saving measurement results, such as ER/EC, periodically.

# Real-time FEC Symbol Error and FEC Based Jitter Tolerance Measurement Functions

Uncorrectable Codeword and FEC Symbol Errors can be measured and displayed on one screen in real-time simultaneously with bit error measurements. Measurement of jitter tolerance and FEC Symbol Error per codeword distribution based on correctable/uncorrectable FEC is supported (MU196040B-042). Both bit error and FEC Symbol Errors are measured at high speed.

# **FEC Symbol Capture Function**

The input data is captured when the number of FEC symbol errors exceeds the threshold setting based on the 400 GbE-defined FEC symbols and Codeword length. The causes of FEC-uncorrectable errors can be analyzed from the captured data (MU196040B-041).

**Capturing Detected FEC Symbols Errors** 

# **Eye Contour**

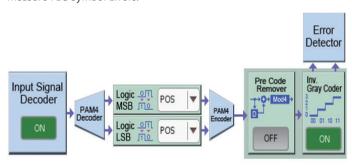

The input signal Eye opening is measured at high speed based on the Bathtub estimate.

In addition to NRZ, the PAM4 Symbol Upper, Middle, and Lower Eye openings are measured, supporting more accurate evaluation of Eye Margin characteristics at BER estimates up to E-20.

# **FEC Analysis Decode Function**

Supports Gray decode of input signal and 1/(1 + D) Mod4 decoding to measure FEC Symbol Errors.

# **PAM4 Bathtub Jitter Analysis**

The input signal jitter and phase margin can be measured automatically using the Bathtub function.

The wideband and high-sensitivity PAM4 ED helps more accurate measurement of DUT performance.

# **All-in-One Measurement Solution**

8-slot main unit accommodates various modules, including PPG/ED, synthesizer, Jitter modulation source, and noise generator. A compact, high cost-performance, next-generation, all-in-one measurement solution can be configured without other external instruments.

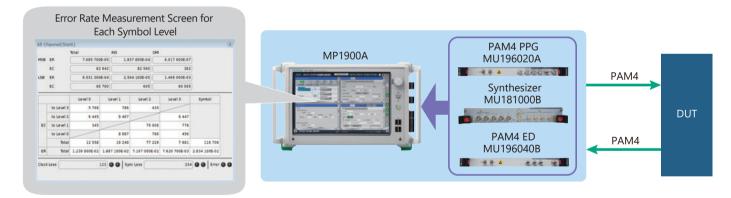

<sup>\*:</sup> Refer to the MP1900A Selection Guide for details of supported multichannel configurations and module combinations. Consult your sales representative for module configurations not described in the MP1900A Selection Guide.

# 64 Gbaud All-in-One NRZ/PAM4 BER Measurement

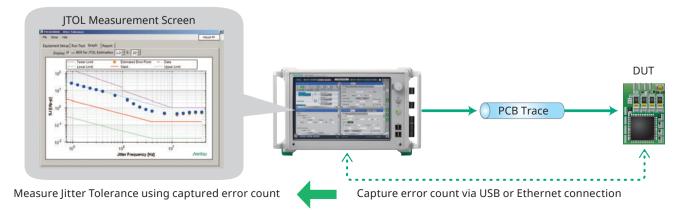

BER can be measured in real-time without using external equipment. In addition, permits error evaluation at each PAM4 symbol.

- World-first all-in-one solution without requiring external equipment
- Baud rates of 2.4 Gbaud to 58.2 Gbaud (PAM4)/64.2 Gbaud (NRZ)
- Module with built-in Clock Recovery (MU196040B-021, 022, 023), 2.4 Gbaud to 32.1 Gbaud, 51 Gbaud to 58.2 Gbaud
- PAM4 Symbol BER evaluation (MU196040B-041)
- Real-time FEC Symbol Error(MU196040B-042) and FEC Based Jitter Tolerance Measurements

# Jitter Tolerance Measurement using DUT BER Counter (MX183000A-PL031)

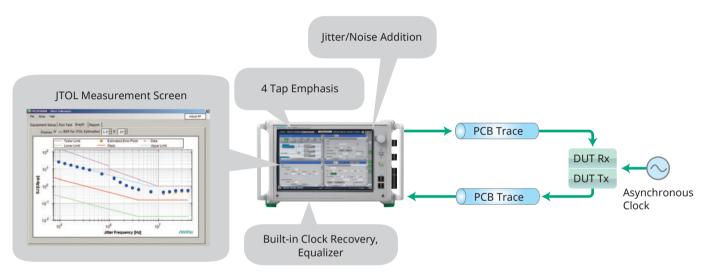

When the DUT has a bit error counter, combination with the MP1900A PPG makes it easy to configure a highly cost-effective Jitter Tolerance measurement environment.

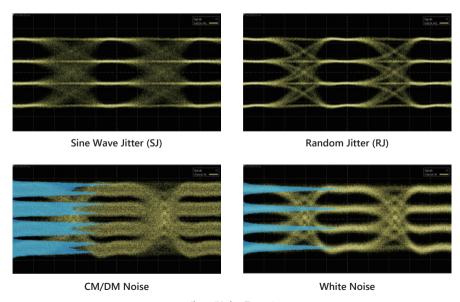

# Versatile Jitter/Noise Addition Function for Jitter Tolerance Tests without Other External Equipment (MX183000A-PL001)

The DUT receiver input stress tolerance test measures the BER under the worst conditions using a stressed signal with added jitter and voltage noise. Adding the Jitter Modulation Source MU181500B and MU195050A for adding CM/DM/White Voltage Noise to the MP1900A series supports all-in-one receiver stress tests for various interface standards. Using the MP1900A high-quality signal prior to jitter and noise addition along with the high-linearity jitter and noise addition function offers powerful support for receiver stress tolerance tests.

- Easy Jitter Tolerance measurement
- PHY device Jitter Tolerance test with impressed SJ/RJ/BUJ
- Mask measurements supporting various standards
- Shorter measurement times using low error rate (1E-12, 1E-15, etc.) estimation function
- Tolerance measurement for device characteristics using four Binary, Upward, Downward, and Binary + Linear measurement methods
- Built-in Jitter Tolerance Mask standards for 200/400G including IEEE 802.3, CEI, etc.
- Support for both user-defined masks and new standards

# **High Transmission Capacity and Excellent Expandability**

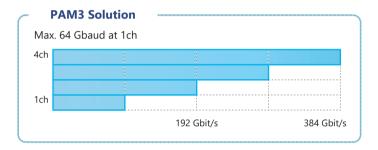

# **Easy Multichannel Measurement Support**

The MP1900A series is an 8-slot, modular, high-performance BERT.

Installing multiple 64G PAM4 PPG module boards in the slots provides the performance for measuring not only 400 GbE systems but also future 800 GbE systems as well. This flexible expandability helps customers maximize product development-cost efficiencies and bring products to market early.

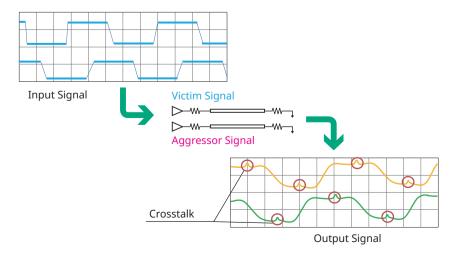

# Supports 64G × 4ch Output Pattern Synchronization

Pattern synchronization for each channel ideal for all-at-once evaluation of parallel interfaces, Crosstalk and Skew tolerance evaluation, D/A converter evaluation and FEC pattern evaluation.

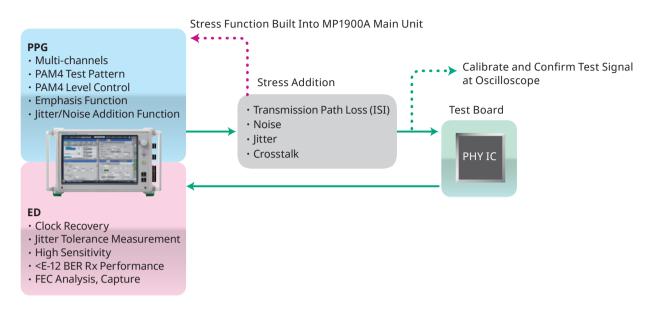

# **Inter-lane Skew Adjustment and Crosstalk Tests**

The phase of each channel can be controlled independently using the option (MU196020A-030). The precision control in 2-mUI steps supports high-accuracy testing of DUT crosstalk characteristics.

- BER and FEC Based Jitter Tolerance Tests

# All-in-One Built-in Stress Test Function

Accurate evaluation of the Rx performance of PHY layer ICs used in high-speed servers, optical transceivers, and Active Optical Cables (AOCs) requiring good compatible connectivity requires correction of the signal performance at the test board input connector. When evaluating ICs supporting various protocols, the stress signal including transmission path loss, jitter, etc., must be corrected for various cases according to the specifications. However, changing the cables, test board, and components connected to the PPG for each protocol is time consuming, lowers work efficiency, and has issues with unstable measurement results.

The MP1900A have built-in ISI, Noise, Jitter, Crosstalk, Emphasis, and Clock Recovery functions required for NRZ and PAM4 signal stress tests to support easy and high-reproducibility evaluations using the all-in-one MP1900A.

# **Jitter Tolerance Test**

Supports addition of various jitter types (SJ1/2, RJ, BUJ, SSC) to the PAM4 PPG output (MU181500B). In addition, the PAM4 ED has a built-in Clock Recovery required for Jitter Tolerance tests as well as high sensitivity and wide analog bandwidth performance for receiving low-amplitude and closed-Eye data signals to support high-reproducibility Jitter Tolerance tests. In addition, measurement based on correctable/uncorrectable FEC is supported.

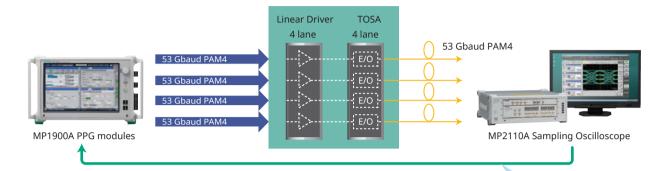

# Burst Error Analysis using Real-time FEC Symbol Error Measurement and FEC Symbol Capture Functions

Uncorrectable Codeword and FEC Symbol Errors can be measured and displayed on one screen in real-time simultaneously with bit error measurements. The FEC symbol capture function captures input data when the number of FEC Symbol Errors exceeds the set threshold. The input data is captured when the number of FEC symbol errors exceeds the threshold setting. The causes of FEC-uncorrectable errors can be analyzed from the captured data.

# **PAM4 PPG/ED Application Example**

# **TOSA, Driver IC Evaluations**

Since the test-signal performance affects the IC performance at evaluation of parts such as TOSA and driver ICs used by optical transceivers requiring analog high-frequency performance, a reference test signal source with fast Tr/Tf and low Intrinsic Jitter is required.

PPG Emphasis adjusted automatically when MP2110A oscilloscope connected

# **Required Test Items**

- · Multi-channel synchronous measurement
- Optimized TOSA TDECQ value using Emphasis and Linearity settings

# Simultaneous Multichannel Measurement of 4ch max. with One MP1900A

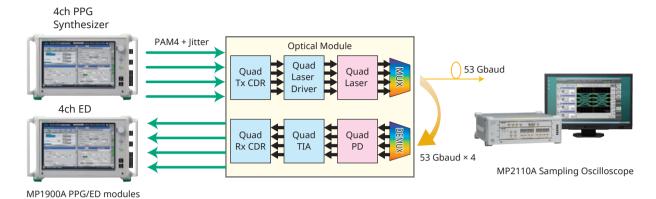

Optical transceiver modules specified as 200 GbE/400 GbE achieve high bit rates using either a 4- or 8-lane optical interface. The MP1900A main unit can accommodate four PAM4 PPG boards and four ED boards in four slots each to perform simultaneous 4ch parallel measurement of multilane integrated optical parts and driver ICs, helping shorten measurement times.

# **Optimized TOSA TDECQ value using Emphasis and Linearity settings**

The TDECQ value is a specific measurement item at 200 GbE/400 GbE PAM4 TOSA evaluation.

The TDECQ value is dependent not only on the signal waveform quality but also on the test signal Emphasis setting and 4-level linearity. Consequently, to examine the true ability, both a high-quality signal source and Emphasis and linearity control functions are required to evaluate the TDECQ characteristics for each setting. The PAM4 PPG MU196020A has built-in Emphasis and linearity control functions supporting high-quality data output with its high Tr/Tf speed and low Intrinsic jitter, which is sufficient for TDECQ optical output evaluation. The functions and performance required for PAM4 signal evaluation are implemented with high-quality waveforms optimized for evaluating TOSA and driver, etc., ICs. Evaluation of TOSA, driver ICs, etc., optimized by implementing functions and performance required for evaluating PAM4 signals using high-quality waveforms. In addition, connecting MP2110A oscilloscope automatically sets optimum Emphasis for TOSA optical signal TDECQ value.

# **Optical Module Evaluation**

# **Required Test Items**

- Simultaneous 4ch BER Measurement
- Optical output waveform optimized using Emphasis and Linearity Control
- Skew and Crosstalk Tests
- Jitter Tolerance Test

# 400-GbE (53G × 4λ) PAM4 BER Measurements

IEEE 802.3 200 GbE/400 GbE EML and optical modules can be evaluated.

Multilane evaluation of 4ch EML is supported by simultaneous and independent driving.

# **Optical Output Waveform Optimization using Emphasis and Linearity Control**

The linearity and crosspoints of each Eye on the screen can be adjusted easily using the 4Tap Emphasis up to 20 dB and PAM4 output linearity control function for fast and high-reliability evaluation.

# **Skew and Crosstalk Test**

Applications using 30-Gbaud class signals require testing using actual equipment as well as logic testing. With pattern synchronization and variable phase functions, the MP1900A easily supports the tests, such as Rx device skew tolerance, crosstalk effect, etc.

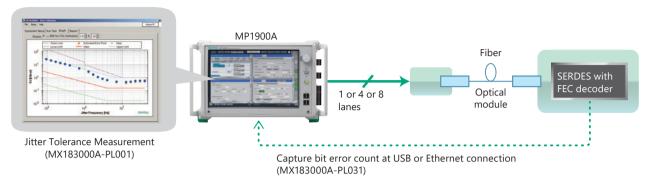

# **Jitter Tolerance Test**

With built-in Clock Recovery required for Jitter Tolerance tests, the PAM4 ED can receive low-amplitude, closed-Eye data signals using its high-sensitivity and wide analog band functions to support high-reproducibility Jitter Tolerance tests.

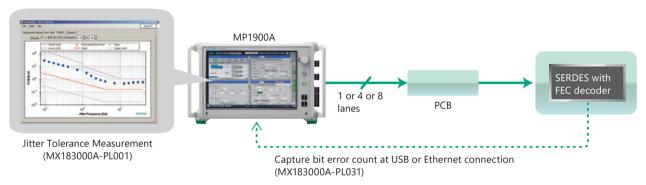

# **Multilane FEC Evaluation**

FEC can be evaluated by combining the FEC pattern generation, error insertion, and reading the DUT bit error count.

## **Evaluating Optical FEC Signal Transmission**

# **Evaluating Electrical FEC Signal Transmission**

# **Required Test Items**

- Generates 1, 4, 8ch FEC patterns
- Inter-lane Skew Adjustment Test and Crosstalk Test
- Executes Jitter Tolerance tests using FEC patterns
- FEC Analysis Assistance using ED Capture Function

## 400 GbE Evaluation

IEEE 802.3-specified 400 GbE SERDES FEC evaluation is supported by simultaneous and independent driving of 1, 4, 8ch FEC pattern data output from the all-in-one MP1900A.

And Captures uncorrectable errors from DUT using DUT error counter read function and displays results at MP1900A.

# **Inter-lane Skew Adjustment Test and Crosstalk Test**

FEC decoding is performed after first adjusting the inter-lane skew of the received signal in SERDES.

Since the MP1900A generates signals for the number of lanes and can generate skew of  $\pm 64$  UI for each lane, it is ideal for testing inter-lane skew adjustment. Additionally, the MP1900A has pattern synchronization and variable phase functions, and easily supports the tests, such as Rx device skew tolerance, crosstalk effect, etc.

# **Jitter Tolerance Test**

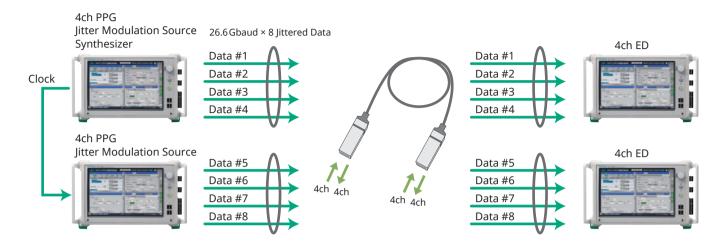

Jitter is impressed on the FEC pattern generated by the MP1900A and SERDES uncorrectable errors are read to implement Jitter Tolerance tests with FEC patterns.

# **FEC Analysis Assistance using ED Capture Function**

Generally, RS-FEC (544, 514) is used for 200 GbE/400 GbE, and RS-FEC (528, 514) is used for 25 GbE.

To understand whether errors generated in the transmission line can be corrected or not by FEC, it is important to both count the number of errors and report the error distribution. Additionally, signal analysis helps understand whether errors occur easily when each symbol transitions in some way. The MP1900A has a function for capturing and displaying received signals by using errors as a trigger. In addition to reporting the error distribution using this function, it is also easy to understand what error is generated by which symbol transition.

# **Active Cable Evaluation**

# **Required Test Items**

- 8ch Simultaneous PAM4 BER Measurement (4ch both ways)
- Crosstalk Test
- Jitter Tolerance Test

# 8ch Simultaneous PAM4 BER Measurement (4ch both ways)

QFSP-type Active Optical Cables (AOC) used by 200 GbE, etc., use 4ch transmission in both directions to achieve simultaneous 8ch transmission. The MP1900A can measure 8ch (8ch PPG + 8ch ED) simultaneously for both excellent performance and shorter measurement time.

# **Crosstalk Test**

Applications using 30-Gbaud class signals require testing using actual equipment as well as logic testing. With pattern synchronization and variable phase functions for each channel, the MP1900A easily supports the tests, such as the impact of AOC crosstalk, etc.

# **Jitter Tolerance Test**

AOCs in data centers are increasingly switching to low I/O amplitude levels to cut power consumption, increasing the importance of interconnectivity. With built-in Clock Recovery required for Jitter Tolerance tests, the PAM4 ED can receive low-amplitude, closed-Eye data signals using its high-sensitivity and wide analog band functions to support high-reproducibility Jitter Tolerance tests.

Four USB2 ports for connecting peripherals

Power Switch

Switches power on and off; Standby LED over power switch lights when power cord connected and Power switch set to off

4 Function Keys

Keys for defining functions using software

**5** HDD Access LED

Lamp that lights during access to built-in HDD

6 Rotary Encoder

Switch to increase/decrease numeric values by turning knob

**7** GPIB

**GPIB** Connector

8 HDD

Slot for secondary 2.5" HDD

Ethernet Connector

External: For Remote Control (Internal: Reserved for future function expansion)

**10** USB Port

Two USB3.0 ports for peripherals

1 HDMI

HDMI connector for displaying screens on external screen

**Power Inlet** 

Socket for connecting 3-pole power cord to supply 100 VAC to 12 VAC or 200 VAC to 240 VAC power

**B** VGA

VGA connector for displaying screens on external screen

**14** Frame Ground Terminal

Terminal for discharging electrostatic charges; connect DUT and common ground using ground strap

# On Using VISA\*6

The National Instruments™ (NI hereafter) NI-VISA\*7 software must be installed to use the MX183000A (this product hereafter). We recommend using NI-VISA saved on the product USB memory stick. Customers may only use NI-VISA saved on the product memory stick. NI-VISA on the memory stick may not be used for other applications with other products.

When uninstalling this product from the controller PC, etc., also uninstall NI-VISA from the USB memory.

National Instruments  $^{\text{IM}}$ ,  $NI^{\text{IM}}$ , and NI-VISA $^{\text{IM}}$  are registered trademarks of National Instruments Corporation.

The PL025 option supports PCIe Gen5. PL021 is required to add PL025.

<sup>\*5:</sup> PL022 supports USB 3.2  $\times$ 1. PL023 supports USB 3.2  $\times$ 2. PL022 is required to add PL023.

<sup>\*6:</sup> Abbreviation for Virtual Instrument Software Architecture. This is I/O software for remote control of measuring instruments via GPIB, Ethernet and USB interfaces

<sup>\*7:</sup> NI-VISA was developed by National Instruments for VXI Plug&Play Alliance standards compliant I/O interfaces.

			BNC-SMA cable	2	
			K261	2	DC Block
			K241C	2	Power Splitter

\*8: We recommend using either the J1789A or J1790A as the coaxial cable for the MU196020A data output. Recommend using coaxial cable J1789A for MU196040B Data IN. The MU196020A data output specifications are defined based on the performance observed using a 70-GHz bandwidth oscilloscope connected as shown below.

The MU196020A Data OUT and MU196040B Data IN connectors, and the J1789A/J1790A cables all use V-connectors. Consequently, for K-connectors, use 34VFK50A adapters as shown in the following figure.

Specifications are subject to change without notice.
